

Durable? A lot more than you think.

Being prior to the formation of earth, the aluminium that we use today is more than 4.5 billion years old. Dinosaurs were extinguished 65 million years ago and, whilst walking on earth's surface, the aluminium they stepped on was already billions of years old. In 1885 two scientists discovered the technologies that turned possible to process aluminium industrially and the first humans to make aluminium window frames, doors, etc. are probably still alive today. From all aluminium transformed by men, 75% is still being used nowadays, thanks to a unique propriety of this metal: being 100% recyclable.

Durable?

The aluminium from your house's windows is billions of years old.

Now, when you look for a durable and resistant product you know that probably the best solution is aluminium.

Knowledge is power and now that you know all this, use your power and choose aluminium products. The world will thank you.
